

Q1. Consider a LAN network with ten computers. If two of them want to transfer a file between these two computers, the data will be transferred

- A. only via network
- B. directly or via network
- C. directly between them

Answer: B. directly or via network ✓

(In a LAN, two computers can communicate directly (e.g., via a crossover cable) or through the network infrastructure.)

Q2. The TCP/IP protocol suite contains

- A. five layers
- B. five protocols
- C. five layers and many protocols

Answer: C. five layers and many protocols ✓

(The TCP/IP model has five layers (Application, Transport, Network, Data Link, Physical) and includes numerous protocols like TCP, UDP, IP, HTTP, etc.)

Q3. The following is host to host:

- A. TCP
- B. Ethernet
- C. Wi-Fi

Answer: A. TCP ✓

(TCP is a host-to-host (end-to-end) transport layer protocol. Ethernet and Wi-Fi are network access technologies.)

Q4. _____ transmission data flow is bi-directional and occurs at the same time.

- A. Simplex
- B. Half duplex
- C. Full duplex

Answer: C. Full duplex ✓

(Full duplex allows simultaneous two-way communication.)

Q5. To intercommunicate between two WANs, we need

- A. switch
- B. hub
- C. router

Answer: C. router ✓

(Routers connect different networks, including WANs.)

Q6. The switch operates at

- A. Network layer
- B. Data link layer
- C. Physical layer

Answer: B. Data link layer ✓

(A switch forwards frames based on MAC addresses, which is Layer 2 of the OSI model.)

Q7. The following is a one-way scheme:

- A. Communication
- B. Transmission
- C. Telecommunication

Answer: B. Transmission ✓

(Transmission is simply the physical sending of data (one-way), while communication implies exchange.)

Q8. The following is a full-duplex device:

- A. Hub
- B. Switch
- C. Router

Answer: B. Switch ✓

(Modern switches support full-duplex communication on each port. Hubs are half-duplex; routers can be full-duplex too, but switches are the classic full-duplex device at the data link layer.)

MECHATRONICS
SPECTRUM
TEAM

Q9. The jitter that happens between devices in full duplex is

- A. delay of arrived packets
- B. difference in delay of arrived packets
- C. interruption in packets

Answer: B. difference in delay of arrived packets ✓

(Jitter is the variation in packet arrival times, not the absolute delay itself.)

Q10. Transmission network example is

- A. Broadcast network only
- B. point to point
- C. broadcast or point to point

Answer: C. broadcast or point to point ✓

(Transmission networks can be either broadcast (e.g., Ethernet) or point-to-point (e.g., PPP).)
